

EAST WEST UNIVERSITY

Project Proposal

Project Name: CheckIt: AI-Assisted Employment Contract Risk Analyzer

Course Title: Entrepreneurship & Project Management

Course Code: AIML501

Semester: Summer-2026

Section: 01

Submitted by

Name: Shairin Akter Hashi

ID: 2026-2-74-022

Date: 18/06/2026

Submitted to

KHAZA NEWAZ MUHAMMAD

Adjunct faculty

Department of Computer Science & Engineering

East West University

CheckIt: AI-Assisted Employment Contract Risk Analyzer

Problem Statement

Employment agreements often contain complex legal terms that can be difficult to understand for individuals without any legal knowledge. In such cases, individuals sign an agreement without understanding the implications of sections which can put them into a disadvantageous position. But there are **no** easy-to-use resources available to assist people in **comprehending** employment agreements.

Project Objectives

Develop an AI-based system using NLP to analyse employment contracts. Identify and classify risky clauses, generate simplified explanations, detect potential labour rights concerns, produce a risk score, and provide a user-friendly web interface for analysis and reporting.

Key Stakeholders

Job seekers, employees, freelancers, fresh graduates, Human Resource (HR) departments, recruitment agencies, small and medium enterprises (SMEs), Legal professionals and consultants, Labor rights and human rights advocacy groups, University career development centers.

Expected Deliverables

The system will provide a web-based platform for employment contract analysis using NLP to extract, classify, and summarize clauses. It will detect legal and human-rights risks, generate automated PDF reports, and display results through a user-friendly risk-scoring dashboard.

Expected Outcomes

- Increased transparency and understanding of employment contracts for non-legal users.
- Early identification of potentially unfair or rights-infringing clauses.
- Improved awareness of labour rights and contractual obligations.
- Reduced risk of uninformed or legally disadvantageous contract signing.
- Uses AI to automatically analyse contracts, making contract insights easier for everyone to access.

Feasibility Considerations

Technical Feasibility

The system is feasible using modern NLP techniques such as transformer-based language models for classification and summarization. Pre-trained models can be fine-tuned for contract-specific and legal-domain text understanding, including risk and rights-based classification.

Time Feasibility

The project can be implemented as a Minimum Viable Product (MVP) within one academic semester, focusing on core features such as document upload, clause extraction, risk classification, and report generation.

Cost Feasibility

Development cost remains low due to reliance on open-source NLP frameworks and cloud-based AI services. Primary expenses include hosting, minimal API usage, and deployment infrastructure.

Resource Feasibility

The project requires software development skills, NLP tools, cloud deployment services, and optional consultation with labour rights experts to validate clause interpretation accuracy.

Legal, Safety, and Human Rights

The system is an informational decision-support tool, not a legal advisory service, and all outputs are AI-generated and not a substitute for professional legal consultation. It ensures data privacy by securely processing contracts without sharing them with third parties. It also flags clauses that may affect worker rights, fairness, and ethical employment practices based on labour law and human rights principles.
